henry harris here provides an account of how scientists came to understand that the bodies of all living things are composed of microscopic units thta we now call cells harris turns to the primary literature the original texts scientific papers and correspondance of medical researchers involved in the formulation of the cell doctrine to reconstruct the events that enabled researchers to comprehend the nature and purpose of cells translating many of these documents into english for the first time harris uncovers a version of events quite different from that described in conventional science textbooks focusing on the scientific history of the genesis of the cell doctrine the author also considers contemporary social and political contexts and shows how these influenced what experiments were undertaken and how the results were represented

intracellular pathogens such as bacteria and parasites have evolved specialized mechanisms to survive and replicate in their host leading to disorders and diseases the principle of these mechanisms is to reprogram the microbicidal cell function in order to disable the host cells defence that aims to control and eliminate foreign invaders devoid of their defence cells become permissive to pathogens invasion the aim of this research topic is to highlight and cover recent understanding of mechanisms

and molecules used by pathogens to interfere with the microbicidal function of cells this research topic will focus on the reprogramming of the cellular dynamics the immune response the phagolysosome biogenesis and the signal transduction pathways by pathogens special attention will be made on non proteic virulence factors however this research topic is not restricted to non proteic virulence factors

what is life fifty years after physicist erwin schrodinger posed this question in his celebrated and inspiring book the answer remains elusive in the way of the cell one of the world s most respected microbiologists draws on his wide knowledge of contemporary science to provide fresh insight into this intriguing and all important question what is the relationship of living things to the inanimate realm of chemistry and physics how do lifeless but special chemicals come together to form those intricate dynamic ensembles that we recognize as life to shed light on these questions franklin harold focuses here on microorganisms in particular the supremely well researched bacterium e coli because the cell is the simplest level of organization that manifests all the features of the phenomenon of life harold shows that as simple as they appear when compared to ourselves every cell displays a dynamic pattern in space and time orders of magnitude richer than its elements it integrates the writhings and couplings of billions of molecules into a coherent whole draws matter and energy into itself constructs and reproduces its own order and persists in this manner for numberless generations while continuously adapting to a changing world a cell constitutes a unitary whole a unit of life and in this volume one of the leading authorities on the cell gives us a vivid picture of what goes on within this minute precinct the result is a richly detailed meticulously crafted account of what modern science can tell us about life as well as one scientist s personal attempt to wring understanding from the tide of knowledge
